

#### 5 V low drop fixed voltage regulator

#### **Features**

- Output voltage tolerance ≤ ±2%
- 150 mA current capability
- Very low current consumption
- Early warning
- Reset output low down to V<sub>O</sub> = 1 V
- Overtemperature protection
- Reverse polarity proof
- Adjustable reset threshold
- Very low drop voltage
- Wide temperature range
- Integrated pull-up resistor at logic outputs
- · Green Product (RoHS compliant)

## **Potential applications**

General automotive applications.

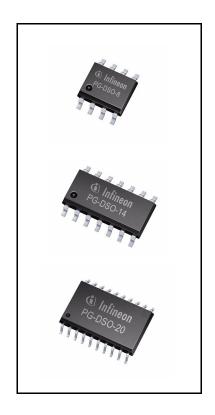

## **Product validation**

Qualified for automotive applications. Product validation according to AEC-Q100/101.

## **Description**

The OPTIREG<sup>TM</sup> Linear TLE4269 is an automotive voltage regulator with a 5 V fixed output. The maximum operating voltage is 45 V. The output is able to drive 150 mA load. The device features short-circuit protection. The thermal shutdown feature switches the output off when the junction temperature exceeds 150°C to ensure the device is not damaged by overheating. A reset signal is generated when the output voltage drops below  $V_Q$  < 4.65 V. The reset threshold voltage can be decreased by an external connection of a voltage divider. The reset delay time can be set by an external capacitor. Reset and sense output have integrated pull-up resistors. If the integrated resistors are not required, the TLE4279 can be used instead. It is also possible to supervise the input voltage by using an integrated comparator to give a low voltage warning.

#### 5 V low drop fixed voltage regulator

#### **Functional description**

#### 4 Functional description

The control amplifier compares a reference voltage, made highly accurate by resistance balancing, with a voltage proportional to the output voltage and drives the base of the series PNP transistor via a buffer. Saturation control as a function of the load current prevents any over-saturation of the power element.

The reset output RO is in high-state if the voltage on the delay capacitor  $C_D$  is greater or equal  $V_{UD}$ . The delay capacitor  $C_D$  is charged with the current  $I_D$  for output voltages greater than the reset threshold  $V_{RT}$ . If the output voltage gets lower than  $V_{RT}$  ('reset condition') a fast discharge of the delay capacitor  $C_D$  sets in and as soon as  $V_D$  gets lower than  $V_{LD}$  the reset output RO is set to low-level.

The time gap for the delay capacitor discharge is the reset reaction time  $t_{\rm RR}$ .

The reset threshold  $V_{\rm RT}$  can be decreased via an external voltage divider connected to the pin RADJ. In this case the reset condition is reached if  $V_{\rm Q} < V_{\rm RT}$  and  $V_{\rm RADJ} < V_{\rm RAQDJ,\,TH}$ . Dimensioning the voltage divider (**Figure 5**) according to:

(4.1)

$$V_{THRES} = \frac{V_{RAD(J, TH)} \times (R_{ADJ1} + R_{ADJ2})}{R_{ADJ2}}$$

the reset threshold can be decreased down to 3.5 V. If the reset-adjust-option is not needed the RADJ-pin should be connected to GND causing the reset threshold to go to its default value (typ. 4.65 V).

A built in comparator compares the signal of the pin SI, normally fed by a voltage divider from the input voltage, with the reference and gives an early warning on the pin SO. It is also possible to superwise another voltage e.g. of a second regulator, or to build a watchdog circuit with few external components.

#### 5 V low drop fixed voltage regulator

**Application information** 

# 5 Application information

The input capacitor  $C_1$  is necessary for compensating line influences. Using a resistor of approx.  $1 \Omega$  in series with  $C_1$ , the oscillating circuit consisting of input inductivity and input capacitance can be damped. The output capacitor  $C_Q$  is necessary for the stability of the regulating circuit. Stability is guaranteed at values  $\geq 10 \ \mu\text{F}$  and an ESR  $\leq 10 \ \Omega$  within the operating temperature range. For small tolerances of the reset delay the spread of the capacitance of the delay capacitor and its temperature coefficient should be noted.

#### **Green product (RoHS compliant)**

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
